## *Physics, biophysics and ecology of soils*

---

|                                                                                                                                                                                                                                   |    |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
| <b>Physical conditions of saline soils with medium and strong degree of desertification in Volga delta</b><br>Fedotova A. V., Umarova A. B., Spasnikov E. V.                                                                      | 1  |
| <b>Conversion of arable land into abandoned increase stability of soil organic matter</b><br>Filimonenko E. A., Uporova M. A., Arbuzova E. A., Ibraeva K., Konstantinov A. O.,<br>Kurganova I. N., Kuzyakov Ya. V.                | 9  |
| <i>Physical, physiological and genetic basis for biological production of soil-plant complexes under natural and controlled conditions</i>                                                                                        |    |
| <b>Field evaluation of resistance to peronosporosis of summer squash samples of VIR collection</b><br>Piskunova T. M.                                                                                                             | 17 |
| <i>Plant physiology and light</i>                                                                                                                                                                                                 |    |
| <b>Polymer gel-substrate and its influence on plants on example of leaf salad</b><br>Panova G. G., Krasnopeeve E. L., Laishevskina S. M., Kuleshova T. E., Udalova O. R., Khomyakov Yu. V.,<br>Vertebnyy V. E., Yakimanskiy A. V. | 24 |
| <i>Precision agriculture and livestock management – new technologies in agriculture based on information technologies</i>                                                                                                         |    |
| <b>Use of NDVI to forecast the yield of spring barley in the North-West region of Russia</b><br>Fesenko M. A., Shpanev A. M.                                                                                                      | 36 |
| <i>Physico-agronomical basis for management of crop production processes, amelioration and soil protection</i>                                                                                                                    |    |
| <b>Agrophysical and biological properties of sod-podzol soil under different types and timing of tillage for barley</b><br>Borin A. A., Loshchinina A. E.                                                                         | 42 |
| <i>Physical and natural modeling of agricultural processes</i>                                                                                                                                                                    |    |
| <b>Forty years of using the van Genuchten empirical functions and a proposal to replace them with physically adequate analogues</b><br>Terleev V. V., Lazarev V. A., Ginevskiy R. S., Garmanov V. V., Dunayeva E. A.              | 49 |
| <i>Equipment and information for agricultural research and technologies</i>                                                                                                                                                       |    |
| <b>Methodic approach to automatic detection of carrot plants infected by viral diseases based on results of spectral survey</b><br>Stepanova E. V., Zhelezova S. V., Startseva L. V., Weller V. E.                                | 62 |
| <b>Development of a method for averaged assessment of soil moisture in areas with temperature heterogeneity during remote measurements</b><br>Babaeva G. R., Huseynova R. O.                                                      | 70 |
